

In the Abstract:

~~The present invention relates to film-shaped~~ Film-shaped administration forms for transmucosal administration of active substances to the human or animal body. The administration forms comprise a base mass having a pH value that is adapted to or approximated ~~are characterized by an adaptation or approximation of the pH value of the base mass intended for the production of the administration form to the physiological pH value of the mucosa to which the administration form is to be applied.~~ [[,]] [[said]] The base mass also comprises ~~comprising~~ a solvent or a mixture of solvents, at least one matrix-forming polymer and at least one active substance. The invention further comprises a process for the production of such preparations, and the use thereof of such preparations as administration forms, particularly for pharmaceutical active substances, such that when the resultant administration forms are used, an irritation of the mucous membrane is reduced or even prevented.
